GrooERP — Data Import Guide

Understanding Item Wise Import vs Add Import

Quick Comparison

Item	Item Wise Import	Add Import (Barcode Master)
Real Title	Add Import — Item Wise Summary	Add Import → Barcode + Master Data / Barcode-Stock Update / Master Data
Workbook	Single sheet: Item Wise Summary (33-column template)	Multi-sheet: Instructions, Barcode Import, Master Data, Existing Master Reference
One Row =	One item + location stock line	One physical barcode / unit
Quantity Field	Close Qty = on-hand / opening stock	Opening Quantity for new barcodes; replacement qty for stock update
Barcode Column	Optional — if blank, Item Code is used as barcode key	Mandatory — must be the real barcode of the unit
Modes	Create approved missing masters + import Existing masters only Update existing stock	Barcode + Master Data Barcode / Stock Update Master Data only
Creates Barcodes	Yes — new IN_STOCK rows + opening ledger entry	Yes, only in Barcode + Master Data mode (with GRC_IN)
Updates Existing Stock	Yes, ADJUST_IN/OUT delta; only IN_STOCK units; history/sold skipped	Only in Barcode / Stock Update mode, after explicit replace confirmation
Masters	Matches existing; missing ones listed for approval; locations never created	Creates missing masters from Master Data sheet; can create/map inside wizard
Best For	Migrating another ERP's closing-stock / opening-balance summary	Full barcode-level onboarding, bulk master creation, bulk qty corrections

Main Conceptual Difference

Item Wise Import — Stock Position Import

Takes the **Item Wise Summary** report, treats **Close Qty** as the on-hand balance, and creates opening stock from it. The Open / Inward / Outward columns are kept only in *customFields.stockSummary* — they do **not** become purchase or sales vouchers. Existing barcodes are never recreated; in update mode only in-stock barcodes are re-quantified, with signed ADJUST_IN / ADJUST_OUT movements.

Add Import — Barcode / Master Workbook

Its Barcode Import sheet requires a **real barcode per row** (Barcode Number, Item Code, Opening Quantity). It has three explicit jobs:

1. **Barcode + Master Data** — create the masters listed on the Master Data sheet, then create the barcodes and opening stock (GRC_IN).

2. **Barcode / Stock Update** — touch existing barcodes only; nothing is created; quantity changes only when you confirm replacement.

3. **Master Data** — create only the masters, no barcodes or stock at all.

The template itself warns that an item-wise summary (e.g. an HSR "Open Qty" report with no barcode numbers) cannot be used in Add Import — that is exactly what Item Wise Import is for.

Similarities

✓ Preview-first workflow: upload → validate → resolve missing masters → preview → confirm; the server re-parses the workbook at execute time.
✓ Never invent barcode numbers or item codes.
✓ Never overwrite existing masters.
✓ Never duplicate an existing barcode.
✓ Route every stock change through the inventory engine.

Which Import to Use

If: Source file is an item-wise closing-stock summary (one row per item/location, barcode may be missing)	**Use: Item Wise Import**
If: You have one row per barcode and want to create units with their masters	**Use: Add Import → Barcode + Master Data**
If: You only need to fix quantities of existing barcodes	**Use: Add Import → Barcode / Stock Update**
If: You only need to seed masters (suppliers, items, HSN, UOM, groups, locations) with no stock	**Use: Add Import → Master Data**

Import Modes — Detailed

Item Wise Import Modes

Create approved missing masters + import	Creates missing master records after approval, then imports stock.
Existing masters only	Skips rows where any master is missing; only imports fully matched rows.

Update existing stock (requires 'Replace existing stock' tick)	Re-quantifies existing IN_STOCK barcodes using ADJUST_IN / ADJUST_OUT delta movements.

Add Import Modes

Barcode + Master Data	Creates masters from the Master Data sheet (dependency order), then creates barcodes and opening stock with GRC_IN.
Barcode / Stock Update	Touches existing barcodes only. Nothing is created. Quantity changes only after explicit replace confirmation.
Master Data only	Creates only the masters (suppliers, items, HSN, UOM, groups, locations). No barcodes or stock are touched.
